

Контролно 1 (LW 06) вариант 1 (1-0-1)

1	2	3	4	5	6 Име на ученик:
1					What keyword allows a method to be called without creating an object?
A			A		static
		B		B	final
	C				void
				D	new
2					Which of the following keywords defines a class that cannot be instantiated directly?
			A		final
	B	B			static
	C			C	abstract
				D	interface
3					What happens if a checked exception is not handled or declared with throws?
					The program runs without any issues.
		B		B	It causes a runtime error.
	C	C			The code will not compile.
			D	D	It is ignored by the JVM.
4					Why can an abstract class have both abstract and non-abstract methods?
			A		Because all methods in an abstract class are optional.
				B	To allow for multiple inheritance in Java.
	C	C			To define a required structure (abstract methods) while providing common, reusable code (non-abstract methods).
		D	D		Because non-abstract methods are automatically treated as final.
5					What type of exception must be either caught or declared in the method signature?
		A			Runtime Exceptions
				B	Errors
	C	C			Checked Exceptions
			D	D	All exceptions
6					What happens when a subclass constructor calls super()?
					It creates a new object of the superclass.
		B		B	It calls a method in the superclass with the same name.
	C	C			It invokes the constructor of the superclass to initialize the inherited part of the object.
			D	D	It makes all the public methods from the superclass available.
7					What happens if two overloaded methods differ only by return type?
			A		The program will run, and the JVM will choose the correct one at runtime.
		B		B	The method called will be determined by the variable type used to catch the return value.
	C	C			It causes a compilation error.
				D	The method with the void return type is chosen by default.
8					What happens if you call a static method through an object reference instead of the class name?
			A	A	It is a syntax error and the code will not compile.
	B			B	The code will compile and run, but it is considered bad practice as it can be misleading.
	C				The method will use the object's state instead of the class's state.
		D			It causes a runtime exception.
9					Why is method overloading resolved at compile time, not runtime?
			A		Because it is a feature of polymorphism.
		B		B	To make the program run faster by delaying the decision.
	C	C			Because the compiler can determine the exact method to call based on the declared types of the arguments.
				D	Because overloaded methods must have different names.
